RUNBEG

RUNBEG loads the BLOCK DATA for:

PLCONS :hdref refid=PLCONS..
CDODP :hdref refid=CDOCP..
PSTUFF :hdref refid=PSTUFF..
NDYCOM :hdref refid=NDYCOM..

Note that many of these are needed for the processing of subroutines that may be used independently of VGRANL. RUNBEG is also the approved way of loading and changing these variables. RUNBEG reads all of its input off FT02F001, &PLSNT, &RUNNT and LPLS. See :hdref refid=FT02.. RUNBEG should be called only once.
