1 acis_process_events

This spec, which is incomplete, describes some of processing steps for continuous-clocking mode data.

- 1.1 Description
- 1.2 Input
- 1.3 Output
- 1.4 Parameters
- 1.5 Processing
- 1.5.1 Error checking

The following steps are performed once prior to the processing of the data for each input ACIS event.

1. obsfile:

- (a) Validation:
 - i. Existence:

If

obsfile
$$\neq$$
 none and (1)

obsfile
$$\neq$$
 NONE (2)

and the obsfile does not exist, then obsfile is changed to "none" and acis_process_-events produces a warning message.

ii. Permission:

If

obsfile
$$\neq$$
 none and (3)

obsfile
$$\neq$$
 NONE (4)

and the file permissions do not allow the obsfile to be read, then obsfile is changed to "none" and acis_process_events produces a warning message.

iii. OBS_MODE:

If

obsfile
$$\neq$$
 none and (5)

obsfile
$$\neq$$
 NONE, (6)

then

- A. If the obsfile does not include the keyword obs_mode, then OBS_MODE is set to "none".
- B. If the obsfile includes the keyword obs_mode and

$$obs_mode = pointing or$$
 (7)

$$obs_mode = POINTING or$$

 (11)

1.5.2 Initializations

1. Focal-point CCD:

If

$$OBS_MODE = pointing or$$
 (126)

$$OBS_MODE = POINTING$$
 (127)

and

$$DATAMODE_{in} = CC33_FAINT or$$
 (128)

$$DATAMODE_{in} = CC33_GRADED,$$
 (129)

then the values of $RA_PNT_{\rm in}$ and $DEC_PNT_{\rm in}$ are used to determine the CCD_ID associated with the focal point. Hereafter this value is referred to as $CCD_ID_{\rm focus}$.*

2. Zeroth-order coordinates:

If

$$OBS_MODE = pointing or$$
 (130)

$$OBS_MODE = POINTING$$
 (131)

and

$$DATAMODE_{in} = CC33_FAINT or$$
 (132)

$$DATAMODE_{in} = CC33_GRADED$$
 (133)

and

$$CONTENT_{in} = TGEVT1, (134)$$

then the CHIPY_ZO_{in} coordinates are processed to obtain the minimum, median, and maximum values:

$$CHIPY_ZO_{\min} = \min (CHIPY_ZO_{in}), \qquad (135)$$

$$CHIPY_ZO_{med} = median(CHIPY_ZO_{in}), and$$
 (136)

$$CHIPY_{ZO_{max}} = maximum (CHIPY_{ZO_{in}}).$$
 (137)

^{*}The focal point is the location associated with the optical axis in the absence of dither. This location should not be confused with the aim point, which is the location illuminated by an undithered point source provided that the source is not offset from the target location.

Only events in the good-time intervals are included in the computation of the values of $CHIPY_ZO_{min}$, $CHIPY_ZO_{med}$, and $CHIPY_ZO_{max}$.

3. acaofffile:

If

$$OBS_MODE = pointing or$$
 (138)

$$OBS_MODE = POINTING$$
 (139)

and

$$DATAMODE = CC33_FAINT or (140)$$

$$DATAMODE = CC33_GRADED, (141)$$

then

(a) TIME_{min}, TIME_{max}, RA_c, and DEC_c:

The acaofffile data are processed to determine the earliest and latest times for which there is aspect information and to determine the right ascension and declination coordinates near the center of the dither pattern:

$$TIME_{min} = min(TIME_{acaoff}), \qquad (142)$$

$$TIME_{max} = max (TIME_{acaoff}), (143)$$

$$RA_c = \text{median}(RA_{acaoff}), \text{ and}$$
 (144)

$$DEC_c = median(DEC_{acaoff}).$$
 (145)

(b) TIME_c:

The acaofffile data are processed to determine the time TIME_c at which the quantity

$$\cos\left(\mathtt{DEC}_{\mathrm{acaoff}}\right)\cos\left(\mathtt{DEC}_{\mathrm{c}}\right)\cos\left(\mathtt{RA}_{\mathrm{acaoff}}-\mathtt{RA}_{\mathrm{c}}\right)+\sin\left(\mathtt{DEC}_{\mathrm{acaoff}}\right)\sin\left(\mathtt{DEC}_{\mathrm{c}}\right) \tag{146}$$

is maximized (i.e. the time at which the telescope is pointed the closest to (RA_c, DEC_c).

(c) RA_ADJ_I, DEC_ADJ_I, RA_ADJ_S, DEC_ADJ_S:

The effective values of RA and DEC are computed for the ACIS-I and ACIS-S arrays. These coordinates are used to determine the values of TIME and CHIPY_ADJ.

i. ACIS-I aim point:

For the ACIS-I array, the values of RA_ADJ_I and DEC_ADJ_I are initialized assuming that the source is at the ACIS-I aim point [i.e. that (TIME, CCD_ID, CHIPX, CHIPY) = $(TIME_c, 3, 965, 963)^{\dagger}$.

ii. ACIS-S aim point:

For the ACIS-S array, the values of RA_ADJ_S and DEC_ADJ_S are initialized assuming that the source is at the ACIS-S aim point [i.e. that (TIME, CCD_ID, CHIPX, CHIPY) = $(TIME_c, 7, 227, 509)^{\ddagger}$.

iii. Target location:

For the CCD at the focal point (i.e. CCD_ID_{focus}), the values of CHIPY are computed for each row of the acaofffile, assuming that the source is at the location specified by RA_TARG_in and DEC_TARG_in. These values of CHIPY are referred to as CHIPY_TARG. If

$$median(CHIPY_TARG) \ge 16.5 and$$
 (147)

$$median (CHIPY_TARG) < 1008.5, (148)$$

then

[†]As described in the Proposers' Observatory Guide, the location of the aim point on the ACIS-I array has drifted with time. The location used here is within a few dozen pixels of the actual aim point, provided the default SIM_Y and SIM_Z offsets are used.

[‡]Again, the location used here is within a few dozen pixels of the actual aim point, provided the default SIM_Y and SIM_Z offsets are used.

A. ACIS-I:

Tf

$$CCD_ID_{focus} \ge 0 \text{ and}$$
 (149)

$$CCD_ID_{focus} \leq 3, \tag{150}$$

then

$$RA_ADJ_I = RA_TARG_{in} \text{ and}$$
 (151)

$$DEC_ADJ_I = DEC_TARG_{in}.$$
 (152)

B. ACIS-S:

If

$$CCD_ID_{focus} \ge 4 \text{ and}$$
 (153)

$$CCD_ID_{focus} \leq 9, \tag{154}$$

then

$$RA_ADJ_S = RA_TARG_{in} \text{ and}$$
 (155)

$$DEC_ADJ_S = DEC_TARG_{in}. (156)$$

1.5.3 Loop over events

The following steps are performed, in sequence, for each event.

1. STATUS:

(a) Exists:

- iii. If

$$doevtgrade = yes, (157)$$

then the value of STATUS[20], the other bit that can be set by acis_process_events, is set to zero.

(b) Does not exist:

If HDU $h_{\rm in}$ does not include a 32-bit column named STATUS, then

2 TBD

- Complete the spec to include all of the timed exposure mode processing.
- Complete sections 1.1, 1.2, 1.3, and 1.4.
- Should CONTENTs other than EVT0, EVT1, TGEVT1, and EVT2 be included?
- Should CONTENT = EVT2 be dropped?
- Should DATAMODEs other than CC33_FAINT, CC33_GRADED, FAINT, FAINT_BIAS, GRADED, and VFAINT be included?
- Are the RA_TARG, DEC_TARG, RA_NOM, DEC_NOM, and TIMEDEL keywords in the output of afe (need obsfile sometimes)?
- What if TIME_RO is not in the infile (output of afe? EVT2 files?)?
- What if a small fraction of the values of CHIPY_TARG are off the chip due to bad aspect?
- Make sure that the STATUS bits are unset and reset properly.
- What about a ff and soff files instead of a sol files?
- Are the β in PHA_RO the same as the β in PHA?
- Should something be done about SKY_1D?
